Germany

Abstract:- This research paper created and used advanced software design to design an automated system to process admissions for tertiary institutions all over the state. Participants in the system will be applicants from various states and countries, as well as staff from the respective institutions. All admission requirements for the institutions are entered into the system and recognized as guidelines for admitting applicants. If the requirement is not met, the admission may be rejected automatically by the system. The turnaround time is twenty-four hours. The method used for this research is waterfall modeling, which is very popular and easy in the software development lifecycle. It is also a linear, sequential approach to the SDCL. The research's findings have been put to the test and are functioning and operating properly to support institutions in Kebbi State in the admissions process. The system covered all the necessary phases of advanced software design, such as requirement elicitation, requirement analysis, functional and non-functional requirements, verification and validation, and many more.

Keywords:- Admission, Automated, Tertiary Institution, Processing, System.

I. INTRODUCTION

Admission is a necessary step in every institution around the globe that allows the applicants to register and complete all the necessary procedures for the specific institution. In some institutions, admission is given manually, while in others, admission is given online, and it takes a long time before the applicant knows his or her status, which leads to late registration. A web-based application called the admission processing system was made using the MySQL database and the PHP Server Scripting Language. The system enables institutions to accept applications online and determine whether the applications meet the specified requirements for admission. Then, the system will process the admission by approving or rejecting it.

Indeed, the automated admission processing system has a communication model between itself and applicants directly to notify them of their admission status.

In this article, all the software design processes, including requirement analysis, design, implementation, testing, and evaluation, were carried out accordingly.

II. OVERVIEW OF THE EXISTING KEBBI STATE TERTIARY INSTITUTION ADMISSION SYSTEM

Almost all tertiary Institutions in Kebbi State have given admission to their applicants in two different ways. Applicants from universities were given admission through the Central Admission Processing System (CAPS), which is a national mandate given to the Joint Admission and Matriculation Board (JAMB). Others, like polytechnic colleges and mono-technics, are selling the scratch cards at banks and filling out the online application form through the institutional website. The entire process of admission, which determines who is qualified for admission and who is not, is carried out manually, which causes a lot of delays in processing. Only the application form can be filled out online.

The admissions officers of all institutions are responsible for downloading applicants from various fields of study, departments, faculties, etc. He or she has the ability to arrange the applicant lists and send them to the various departments for recommendation. After the recommendation from the head of department, the applicant list is returned to the admissions officers for observation. Then, the list is also sent to the head of the institution for final approval.

III. THEORY

- **Automated Admission System:** is a system that build to help the entire Institution in the admission process, this system is serves as solution to the Kebbi State Tertiary Institution to process all their admission easily. The system also contains all the admission requirement of the respective Institution around the State.
- **Management Information System:** A management information system (MIS) is a set of systems and procedures that gather data from a range of sources, compile it and present it in a readable format. Managers use an MIS to create reports that provide them with a comprehensive overview of all the information they need to make decisions ranging from daily minutiae to top-level strategy. Today's management information systems rely largely on technology to compile and present data, but the concept is older than modern computing technologies.
(<https://smallbusiness.chron.com/management-information-system-2104.html>)

- Model View Controller:** is an architecture pattern in software development that is divided into three interconnected elements (Aniche et al., 2018; Guaman et al., 2021) MVC is very popular architectural pattern due it advantages that separate application focus for user interface and data management (Guaman et al., 2021).

The present the data structure, the view is information that will be displayed to the end-user, while the controller is the link the model, View, and additional extension to process HTTP requests so that they can produce webpages.

- CodeIgniter:** CodeIgniter is an application development framework, which can be used to develop websites, using PHP. It is an Open Source framework. It has a very rich set of functionality, which will increase the speed of website development work.

using CodeIgniter, you will save a lot of time, if you are developing a website from scratch. Not only that, a website built in CodeIgniter is secure too, as it has the ability to prevent various attacks that take place through websites.

If you know PHP well, then CodeIgniter will make your task easier. It has a very rich set of libraries and helpers. By

IV. METHODOLOGY

This stage of the research was carried out using waterfall model method. The Waterfall Model was the first Process Model to be introduced. It is also referred to as a **linear-sequential life cycle model**. It is very simple to understand and use. In a waterfall model, each phase must be completed before the next phase can begin and there is no

overlapping in the phases. The Waterfall model is the earliest SDLC approach that was used for software development.

The waterfall Model illustrates the software development process in a linear sequential flow. This means that any phase in the development process begins only if the previous phase is complete. In this waterfall model, the phases do not overlap.

V. SYSTEM DESIGN

A. Requirement Elicitation

Table 1: Requirement Elicitation

| Requirement | Behavioral Measure | Technical Measure |
|--|---|--|
| Visiting the automated admission processing system | The applicant, administrator, or admissions officer can visit the system via the internet. | system can give access to the applicant, admin, and admission officer via the internet. |
| Login | Types of users using the system (public, applicants, admission officer, admin) | The system allows the existing login credentials to access the integrated models. |
| Sign up | Applicants. | The system allows the new applicant to enroll in the system. |
| User discrimination | Unfair or prejudicial treatment of users | |
| User verification | Regularly checking that the user is still with the system | The system uses login credentials to verify that the attempted user exists. |
| User type | Applicants, Admission officer, Admin | The system allows each type to access their role. |
| Ability to view the applicants | Admissions officers can view all the applicants. | The system allows the admissions officer to view the applicant and schedule. |
| Access the database always | Admission officer can access the database | The system allows to access the database |
| Ability to recommend and approve the admission automatically | The system has the ability to determine whether the applicant meets the requirement or not. | The system can determine the approval of admissions automatically based on admission requirements. |

B. Requirement Analysis

Table 2: Requirement Analysis

| Public | Applicant | Admission Officer | Admin |
|--|--|--|---------------------------------------|
| Visiting the system | Login | Added from Admin | Login |
| Apply for the suitable program to become an applicant. | Sign up | Login | Sign Up by official sign-up links |
| | Verification | Verification | Verification |
| Ability to download the admission requirements and guidelines. | Submission of the application form | Received application forms from applicants | Managing the users |
| | Ability to check the admission status | Ability to view the admitted students or rejected applicants | Ability to add, edit and remove users |
| | Ability to download the offer of admission | Ability to change the program after admission by the system | |

C. Requirement Definition

Table 3: Requirement Definition

| Functional | Non-Functional |
|--|---|
| Login: system will allow the users to log in | Systems are loaded into every web browser. |
| Sign Up: system will allow the user to create account. | Authorize the user credentials according to the Sign Up requirement |
| Filling of the application form | System are performing the admission process according to the need. |
| Admission requirements model | Ability to check all the requirement one by one |
| Admission processing model | Ability to process the admission according to the need |
| Approval and rejection messages | System are handling the error, rejection message |
| Authentication and Authorization | |
| Check admission status | |
| Printing of admission letter | |
| Printing of rejection letter | |
| History of the applicants, admitted, rejected | |

D. Authentication workflow

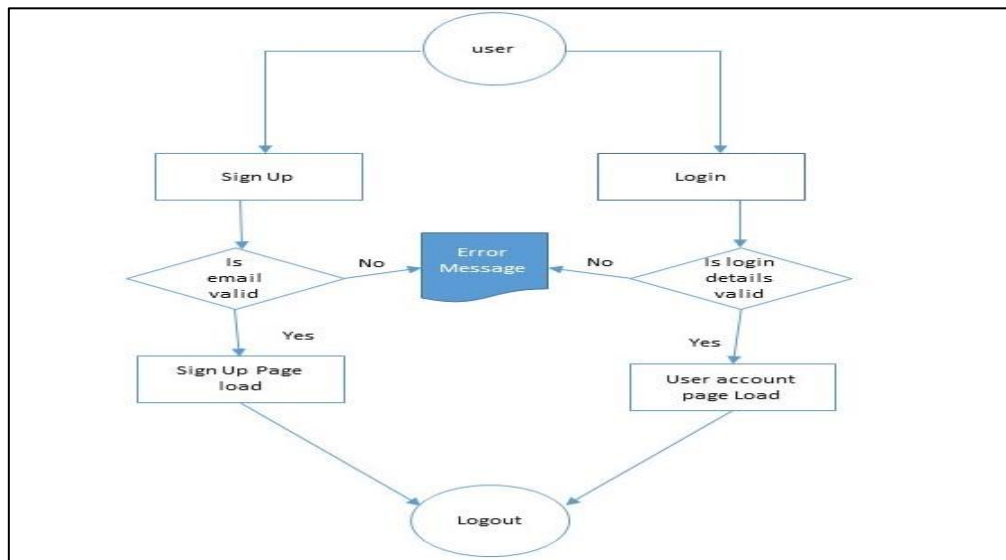

Fig. 4: Use Case Diagram of Authentication workflow

This use case diagram, as shown in Figure 4, has two users, namely, the signup user and the login user. This authentication model will verify the credentials of both users before allowing them to use the system. For signup, the user is required to supply a valid email address; if it is valid, the system will allow them to create an account; otherwise, the system will deny it and display an error message.

In login, the attempt user is required to supply the login credential register with us, then the system will check the database and compare if it exists or not. Once the condition is true, the system will allow the user to access the account; otherwise, the system will display an error message to the attempt user.

VI. SYSTEM MODELLING

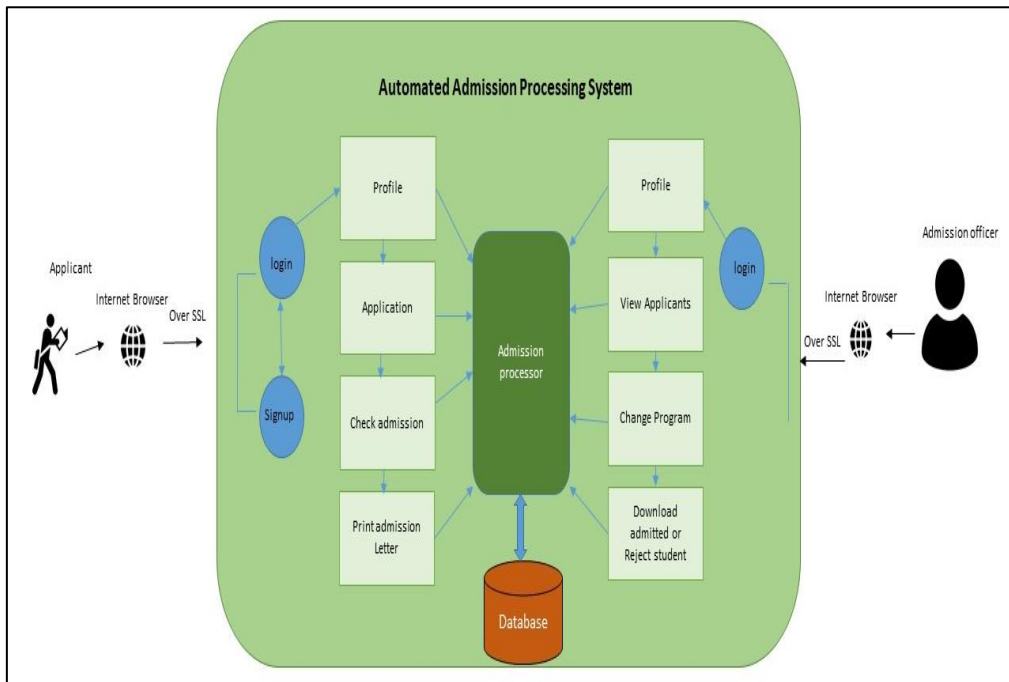

Fig. 5: Use Case Diagram of General Dataflow

The activity diagram, as shown in Figure 5, shows how automated admission processing system activities flow. This flow starts with the applicant accessing the web browser and then the system, i.e., the automated admission processing system. After that, the applicants can login to their account or create a new account, respectively, and then they can start application, check their admission status, or print an admission letter.

In the admission section, the admission officer can access the system through a web browser and have the ability to view the applicants, change the program if the applicant requires it, and download the admitted or rejected students. In

this diagram, the admissions processor shows how all the admissions processes take place, such as the determination of admission through the admission requirement, rejection of admission, and so on.

VII. IMPLEMENTATION/CODING

In this stage, the designation and modeling of the system are converted into a computer programming language for implementation. PHP Scripting Language, CSS, Bootstrap, and JavaScript are recommended as development languages. then MYSQL Database is used as the backend. The images below show some pages of the system.

A. Home Page

Fig. 6: Home Page of the system

This page serve as home page and briefly indicated on how to apply for admission. It appears to be an index file in

the system which will automatically display when user lunch the system.

B. Login Page

Fig. 7: Login Page

This is the authentication page of the system, where user can log in with their login credentials for authentication. It also provided a link for those who does not have an

account or register with system. The link will redirect to the sign up page to enable the new user to create their account.

C. Sign-Up Page

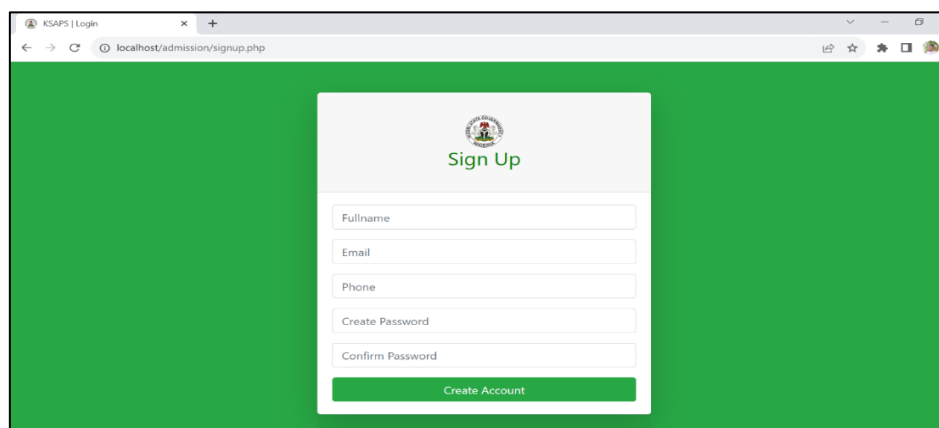

Fig. 8: Sign-Up page

In this page, new user has ability to create account with system using valid email address. It also allows the user to

provide a user-define password which will serve as a secret code or pass code to ensure the security of the system.

D. Applicant Profile Page

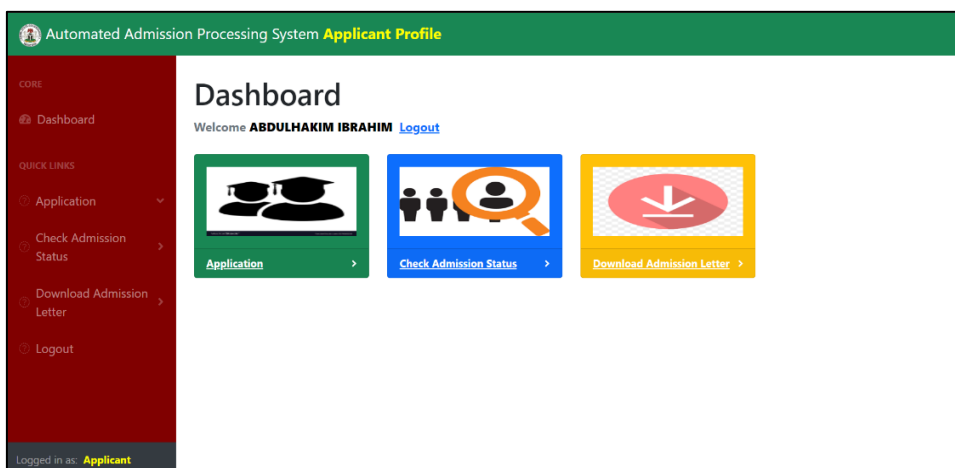

Fig. 9: Profile Page

Profile page carry the session of each user and allow them to access the entire resources. On the above figure 9, the page has three function: Application, Check Admission Status, Download Admission Letter. It also integrated with

the admission processor which determine whether the applicant is due for admission or not. In this page all the entire process for admission is took place and feedback the process will be access through the page.

E. Application

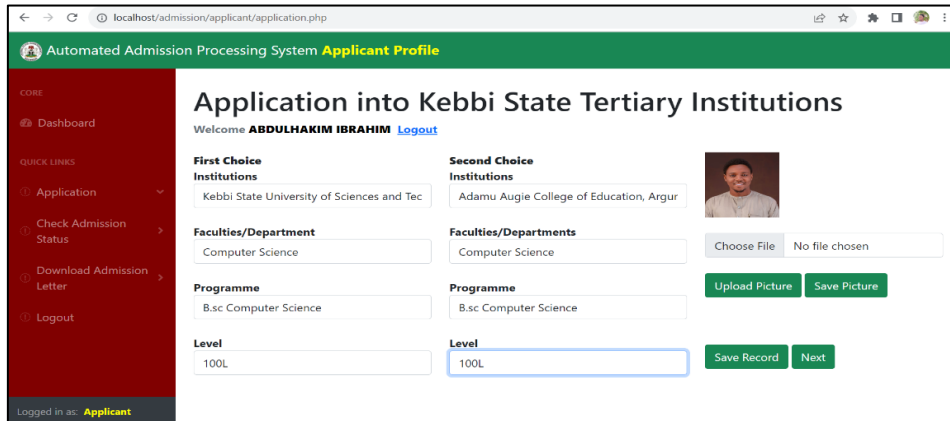

Fig. 10: Application into Kebbi State Tertiary Institution

This page contains application requirement such as Institutions to apply, Faculties/Department, Programme, Level and Photograph of the applicant. It required the O'level

result and other admission requirement which adopted by the State Government.

F. Check Admission Status-waiting stage

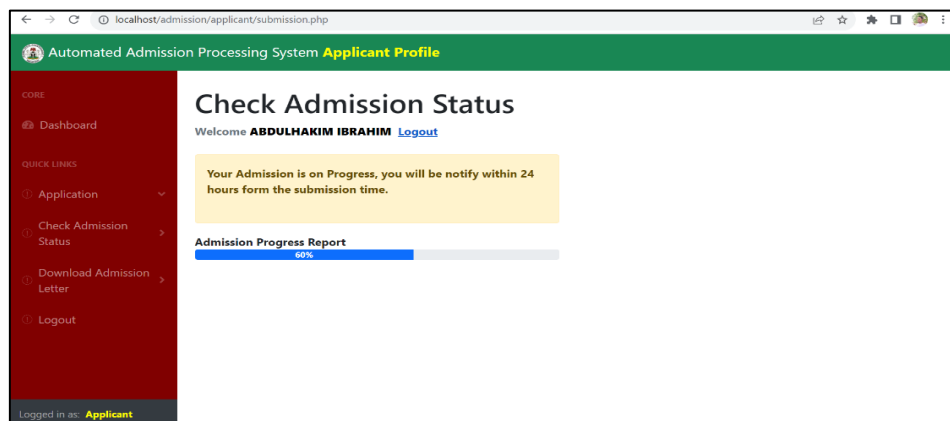

Fig. 11: Check Admission Status-awaiting stage

G. Check Admission Status-Approved Page

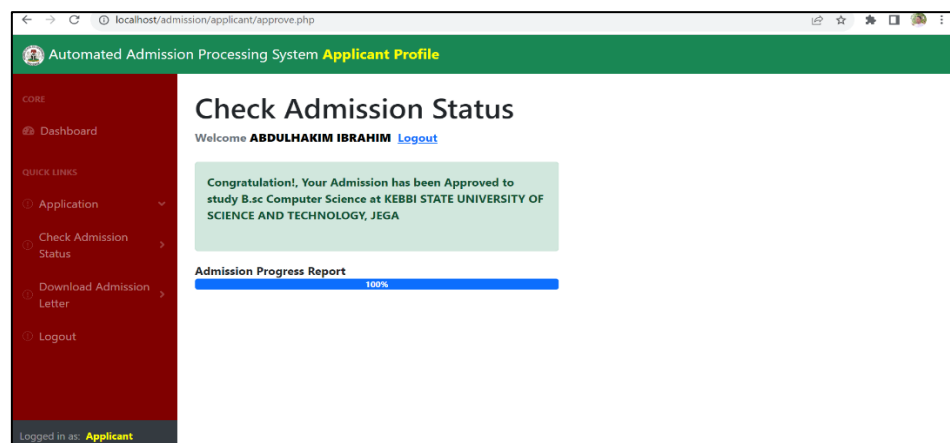

Fig. 12: Check Admission Status-Approved Page

H. Download Admission Letter

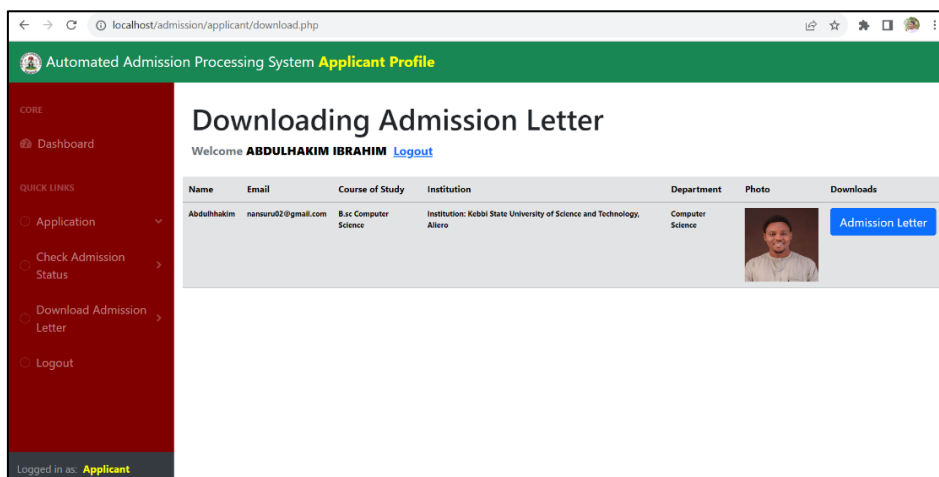

Fig. 13: Download Admission Letter

I. Admin Panel

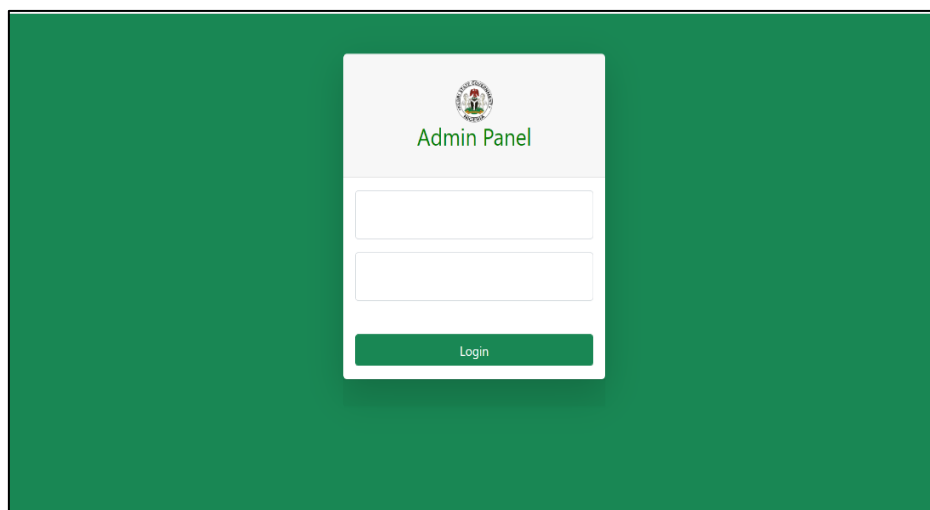

Fig. 14: Admin Panel

J. Admin-Dashboard

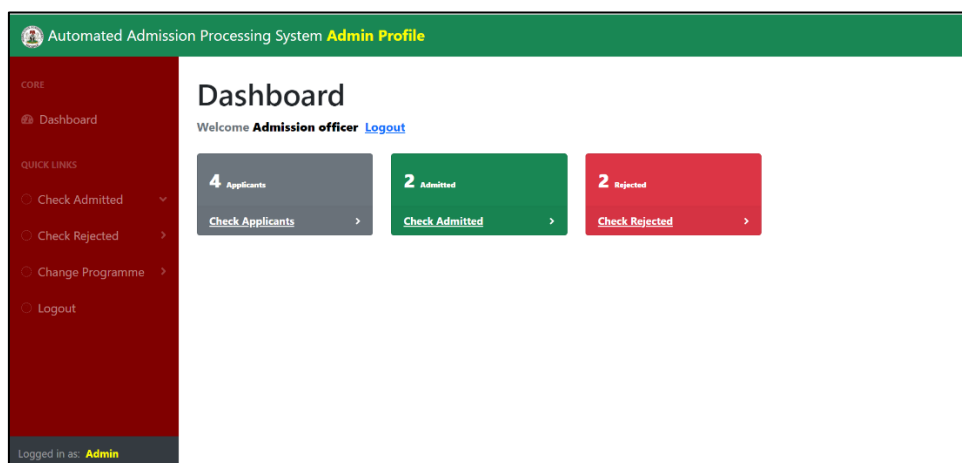

Fig. 15: Admin –Dashboard

VIII. SYSTEM TESTING

In this section, testing is carried out to test every component of the system that has gone through the implementation stage. The table below shows the testing black box results.

Table 4: Testing Black box

| Test ID | Description | Expected result | System-Provided Result |
|---------|---|--|------------------------|
| 1 | The Users Sign-up and Logs into the System | The account created and login successfully | As Expected |
| 2 | Users fill in personal data and edit | Data can be filled in and modify | As Expected |
| 3 | Users choose the institutions, Departments, and Programme | The list of institutions and their respective programme were selected successfully | As Expected |
| 4 | The users fill in the previous qualification as admission requirement | Data can be filled in successfully | As Expected |
| 5 | Users check the admission status | The current admission status display on the users Dashboard | As Expected |
| 6 | Users download the admission letter | The admission letter is downloading to the users through their account | As Expected |
| 7 | Admin perform change programme | The programme has been change to particular applicant | As Expected |

IX. CONCLUSION

This research paper will help the Kebbi State Tertiary Institution admit their students as well as manage their information. All the necessary steps involved in the advanced software design are carried out accordingly, such as analysis, design, implementation, and testing. The method used in conducting this research is the waterfall model.
